                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and sorperty. The plant is a crop plant such as mainze or soybean. The method of producing a transformed plant to auch as mainze or soybean. The method of producing a plant with the cacombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant with the polynucleotide or polypeptide is useful for improving plant with the conformant DNA construct is useful for improving plant with the conformant DNA construct is useful for improved plant properties. Conformance to herbicides, extreme osmoctic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth rapid and/or content, improved yield by modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress condition, improved lightin production or improved galactomannan copiection, improved lightin production or improved galactomannan copiection, improved lightin production or improved galactomannan copiection, improved lightin production or improved galactomannan copiection, improved production. The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence cated for this patent did not format from USPTO at sequence at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 66 FLINLAVSDLLLCITAVPITPVLAFMKRWIFGIIMCKLVPTCQAFSVLISSWSLCYIAID 125

The invention useful in developmental biology and in elucidating call signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

a mammal. The nucleic acids are useful for identifying an animal homolog of DmGPCR, by screening databases or libraries. The compounds identified as binding partners or modulators of GPCR binding are useful for treating diseases in animals, and for control insects that are harmful or cause injury to plants or animals. Diseases treated include infections (e.g. viral and human immunodeficiency virus, HVI), cancer, pain, Parkinson's disease, hypotension, hypertension, diabetes, obesity, atherosclerosis, autoimmune disorders, and psychotic and neurological disorders (axiety, schizophrenia, manic depression, delixium, dementia, severe mental retardation, dyskinesias, Huntington's disease or Tourette's syndrome). The nucleic acids can be used for genetic mapping, and producing the GPCRs. Anti-GPCR antibodies can be used in therapy, diagnostic assays and for modulating GPCR activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     413

                                                                                                                                                                                  The invention relates to a novel G protein-coupled receptor (GPCR) polypeptide and its polynucleotide. The polypeptide is useful for preventing or abrogating insect or nematode infestation of a plant. GPCR polypeptide is useful in cell therapy. The present sequence is fruit fly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a method of identifying a modulator of binding and/or function between a Drosophila melanogaster G protein coupled creeptor (DmoDRAI) and a DmoDRAI binding partner, comprising contacting DmoGPCR and the binding partner in the presence of a candidate compound and determining the effect of the compound on binding and/or function. Also described are: a method for controlling a population of insects; and a method of treating or preventing a disease or condition caused by an ectoparasite. The invention is used to control insects, particularly flies, tick, fleas, lice, mites or cockroaches and to prevent or treat a fisease caused by an ectoparasite, particularly Alzheimer's, parkinson's, Huntington's disease and other neuromuscular and neurodegenerative diseases. This is the amino acid sequence of Drosophila melanogaster G protein coupled receptor 1 (DmGPCR1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      181

composition (VII) comprising (II), (II), (IV) or (V) and a carrier or composition (VII) comprising (I), (II), (IV) or (V) and a carrier or diluent. (I) is useful for identifying a compound which binds (I) and indentifying an animal homologue of (I). (II) is useful in producing (IV) or a homologue or their fragment. (IV) is useful for inducing an immune componee in a memmal against (IV) and in identifying a compound binding to (IV). (IV) is useful in identifying a compound binding to (IV). (IV) is useful in identifying a compound that modulates the activity of (IV) and in identifying a modulator of binding between (IV) and a DmGPCR binding partner. (I), (IV), (V) or (VI) is useful in treating cancer cell, tumour growth. (I) or (IV) is useful in treating cancer cell, tumour growth. (IV) is useful in treating cancer cells, inflammatory bowel disease, multiple sclerosis, thyroiditis, rheumatoid arthritis. (VI) is useful in treating disease as the condition such as metabolic disorder, interaction, myccardial inflammatory backer, renal failure, oxidative stress-inflamman disorder, organ transplantation, myccardial inflammatory disorder, and cancer. (VI) is useful for relating disease in animals and for control of insect that are injurious or harmful to plants or animals. This is the amino acid sequence of prosophila G-protein coupled receptor DmGPCRI.

The present invention relates to a method (M1) for identifying a modulator of binding between a Drosophila melanogaster G-protein coupled receptor (DMGPCR) and a DMGPCR binding partner. The method involves contacting a DmGPCR binding partner and a composition comprising a DmGPCR in the presence and absence of a putative modulator compound; detecting binding between the binding partner and the DmGPCR and determining compared to binding in absence of the putative modulator is increased or decreased compared to binding in absence of modulator. DmGPCR modulators cidentified by (M1) are useful for treating diseases such as viral infection caused by HIV-1 or HIV-2, pain, cancer, Parkinson's disease, thrombosis, stroke, renal failure, inflammation, rheumatoid arthitis, cutcoimmune disorder or psychotic and neurological disorder. The present sequence is one such DmGPCR. Identifying modulator of Drosophila melanogaster G-protein coupled receptor (DmGPCR) useful for treating diseases such as cancer, obesity, etc., by determining effect of modulator on binding between DmGPCR and Neuroprotective, viral infection, HIV infection; pain; cancer; Parkinsons disease; hypotension; hypertension; diabetes; obesity; atherosclerosis; thrombosis cerebrovascular ischemia; renal failure; inflammation; rheumatoid arthritis; autoimmune disease; psychotic disorder; neurological disease; G-protein coupled receptor; Ξ̈́ Larsen Disclosure; SEQ ID NO 2; 92pp; English Kubiak TM, 20-OCT-2000; 2000US-00693746. 99US-00425676 (PHAA) PHARMACIA & UPJOHN Drosophila melanogaster.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of binding a Drosophila melanogaster G-protein coupled receptor (DmGPCR) with a DmGPCR binding partner. The invention is used to control an insect population, particularly a fly, fruk, mite, flea or cockroach population, or to treat or prevent a disease or condition caused by ectoparasites, particularly in a companion animal, livestock, horse or a human. The present sequence represents the amino acid sequence of a Drosophila melanogaster G-protein

The sequence represents a G protein-coupled receptor-like (GPCR-like) receptor protein. GPCR-like receptors and their associated nucleic acids may be used to identify candidate compounds for their ability to modulate the activity of GPCRs. The sequences therefore are useful for treating and preventing infection by endoparasitic and ectoparasitic invertebrate parasites, especially helminths and insects, and particularly ailments related to aberrant neurological and neuromuscular function
                                                                              G protein-coupled receptor-like receptor; GPCR-like receptor; helminth; andoparasite; ectoparasite; invertebrate; insect; neurological disorder; neuromuscular disorder; human; nematode; lobster; locust; mollusc; leech; fruitfly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Using G-protein-coupled receptor (GPCR)-like receptors to identify candidate compounds for the treatment and prevention of invertebrate parasites, especially helminths and insects.
